Transmission Structures
The SDG&E Sycamore-Peñasquitos 230-kV Transmission Line Project requires the replacement of wooden H-frame structures with new double-circuit tubular steel poles within Segments A and D. Figure 1 shows a cross-section of the existing and proposed transmission structures in Segments A and D. The average height of the new 230-kV poles is 120 feet in Segment A and the new 69-kV poles range in height from 70 to 95 feet in Segment D.

Figure 2: Typical Cross-Section of Existing and Proposed Structures

Schedule for Scoping
The CPUC will conduct three public Scoping Meetings in the Project area, as shown in Table 1. The purpose of the scoping meetings is to present information about the Proposed Project and the CPUC’s decision-making processes, and to listen to the views of the public on the range of issues relevant to the scope and content of the EIR. A court reporter will be present to record all verbal comments made at the scoping meetings.

Scoping Comments: You may submit comments in a variety of ways:
1. U.S. mail: Billie Blanchard (CPUC Project Manager)
   California Public Utilities Commission
c/o Panorama Environmental, Inc.
   One Embarcadero Center, Suite 740
   San Francisco, CA 94111
2. Email: sycamorepenasquitos@panoramaenv.com
3. Fax: 650-373-1211
4. Making a verbal statement or handing in a written comment at a scoping meeting

All comments for the CPUC’s CEQA scoping period must be received by September 16, 2014.

Fact Sheet

SDG&E Sycamore-Peñasquitos 230-kV Transmission Line Project
San Diego County

San Diego Gas and Electric (SDG&E) proposes to construct and operate a new 230-kV transmission line between the existing SDG&E Sycamore Canyon and Peñasquitos Substations in San Diego County, California. The SDG&E Sycamore-Peñasquitos 230-kV Transmission Line Project (Proposed Project) is subject to review under the California Environmental Quality Act (CEQA).

The environmental review of the Proposed Project is being managed by the California Public Utilities Commission (CPUC). The CPUC, as the lead agency, will prepare and publish an Environmental Impact Report (EIR) in compliance with CEQA requirements.

Project Overview
If the Proposed Project is approved, SDG&E would construct an approximately 16.7-mile long 230-kV transmission line between the existing SDG&E Sycamore Canyon and Peñasquitos Substations. The Proposed Project would consolidate two existing 69-kV power lines onto double-circuit, steel structures, replacing the existing, predominately wood structures. The Proposed Project can be divided into four segments, as shown in the figure on the following page. The four segments include:

- **Segment A: Sycamore Canyon Substation to Carmel Valley Road**
  Construction of 8.31 miles of 230-kV transmission line on new tubular steel poles.
- **Segment B: Carmel Valley Road to Peñasquitos Junction**
  Installation of 2.19 miles of 230-kV power line on existing steel structures.
- **Segment D: Peñasquitos Junction to Peñasquitos Substation**
  Installation of 3.34 miles of 230-kV power line on existing steel towers. In addition to these four segments, the Proposed Project would also include modifications to the Sycamore Canyon, Peñasquitos, San Luis Rey, and Mission Substations.

Project Purpose
SDG&E has stated that the Proposed Project objective is to:
1. Ensure the SDG&E bulk electric system continues to meet reliability criteria
2. Promote compliance with State of California policy goals related to renewable integration and Once-Through Cooling retirement
3. Meet the San Diego metropolitan area’s forecasted load growth economically and reliably
4. Deliver energy more efficiently to the load center in San Diego

SDG&E’s objectives will focus the formulation of alternatives to the Proposed Project. CEQA does not, however, require that alternatives meet each and every objective; the stated objectives therefore do not absolutely constrain development of alternatives to the Proposed Project.

Proposed Project
The Proposed Project would be located within the cities of San Diego and Poway in San Diego County in existing SDG&E right-of-way or franchise. A portion of the Proposed Project would be located on the Marine Corps Air Station Miramar. Construction of the Proposed Project would result in a new 230-kV transmission line between the existing Sycamore Canyon and Peñasquitos Substations. The Proposed Project includes four transmission line segments and modifications to up to four existing substations.

For additional information on the SDG&E Sycamore-Peñasquitos 230-kV Transmission Line Project, and a schedule of public meetings, please check the CPUC project website at: http://www.cpuc.ca.gov/Environment/info/panoramaenv/Sycamore_Penasquitos/index.html
Alternatively, you can call the project hotline at (650) 373-1200 or send an email to the project team at sycamorepenasquitos@panoramaenv.com.
SEGMENT A: SYCAMORE CANYON SUBSTATION TO CARMEL VALLEY ROAD

SDG&E would construct an approximately 8.31-mile long 230-kV transmission line on 36 new double-circuit 230-kV and two 138-kV tubular steel poles (120-foot and 75-foot average height, respectively) from the Sycamore Canyon Substation to Carmel Valley Road. Two existing transmission lines (TL 13820 and TL 13825, which both terminate at Chicarita Substation) would be relocated to the new tubular steel poles, and approximately 42 wood H-frame structures, two tubular steel poles, one double-circuit cable pole, and two single-circuit wood monopoles associated with the two existing transmission lines would be removed.

A portion of one transmission line would be undergrounded as it enters the Sycamore Canyon Substation, and one existing transmission line would be relocated to approximately two new 230-kV structures within and immediately adjacent to the Sycamore Canyon Substation to make room for the new 230-kV connection at the substation.

SEGMENT B: CARMEL VALLEY ROAD

SDG&E would construct an approximately 2.84-mile long 230-kV underground transmission line in Carmel Valley Road. Two 160-foot tubular steel cable poles for underground/overhead transmission conversion would be placed at the ends of the undergrounded segment. One double-circuit steel lattice tower and one 138-kV H-Frame structure would be removed.

SEGMENT C: CARMEL VALLEY ROAD TO PENASQUITOS JUNCTION

SDG&E would install approximately 3.34 miles of 230-kV conductor on existing double-circuit transmission line in Carmel Valley Road. Two existing transmission lines (TL 13820 and TL 13825, which both terminate at Chicarita Substation) would be relocated to the new tubular steel poles, and approximately 42 wood H-frame structures, two tubular steel poles, one double-circuit cable pole, and two single-circuit wood monopoles associated with the two existing transmission lines would be removed.

A portion of one transmission line would be undergrounded as it enters the Sycamore Canyon Substation, and one existing transmission line would be relocated to approximately two new 230-kV structures within and immediately adjacent to the Sycamore Canyon Substation to make room for the new 230-kV connection at the substation.

SEGMENT D: PENASQUITOS JUNCTION TO PENASQUITOS SUBSTATION

SDG&E would install approximately 2.19 miles of 230-kV conductor on existing double-circuit transmission line in Carmel Valley Road. Two existing transmission lines (TL 13820 and TL 13825, which both terminate at Chicarita Substation) would be relocated to the new tubular steel poles, and approximately 42 wood H-frame structures, two tubular steel poles, one double-circuit cable pole, and two single-circuit wood monopoles associated with the two existing transmission lines would be removed.

A portion of one transmission line would be undergrounded as it enters the Sycamore Canyon Substation, and one existing transmission line would be relocated to approximately two new 230-kV structures within and immediately adjacent to the Sycamore Canyon Substation to make room for the new 230-kV connection at the substation.

SEGMENT E: PENASQUITOS SUBSTATION TO BLACK MOUNTAIN PARK

SDG&E would install approximately 3.34 miles of 230-kV conductor on existing double-circuit transmission line in Carmel Valley Road. Two existing transmission lines (TL 13820 and TL 13825, which both terminate at Chicarita Substation) would be relocated to the new tubular steel poles, and approximately 42 wood H-frame structures, two tubular steel poles, one double-circuit cable pole, and two single-circuit wood monopoles associated with the two existing transmission lines would be removed.

A portion of one transmission line would be undergrounded as it enters the Sycamore Canyon Substation, and one existing transmission line would be relocated to approximately two new 230-kV structures within and immediately adjacent to the Sycamore Canyon Substation to make room for the new 230-kV connection at the substation.

These constraints were not anticipated when the Sunrise Powerlink Project was approved. In its 2012/2013 Transmission Plan the California Independent System Operator (CAISO) identified this line as a reliability driven project eligible for competitive solicitation due to policy benefits. On March 4, 2014 the CAISO selected SDG&E in conjunction with Citizens Energy Corporation to develop the Proposed Project. A portion of Segment A and Segment D follow the same alignment of the Coastal Link portion of the Sunrise Powerlink Project. The remaining segments of the Proposed Project differ from the old Sunrise Coastal Link. Segment A extends further north to Carmel Valley Road, Segment B is located north of SR-56 within Carmel Valley Road, and Segment C connects Segment D to Carmel Valley Road. The central portion of the Coastal Link Project was located underground south of SR-56 and connected directly to Segment D of the Proposed Project.

Project Estimated Schedule

Scoping period – August 18 to September 16, 2014
Scoping Meetings – August 25 & 26, 2014
Draft EIR – Early 2015
Final EIR – Early-Mid 2015
Construction – June 2016 to June 2017
