SUBJECT: *One Paseo – EIR Alternatives Traffic Analysis*

Confidential Communications

This transmittal is intended for the recipient named above. Unless otherwise expressly indicated, this entire communication is confidential and privileged information. If you are not the intended recipient, do not disclose, copy, distribute or use this information. If you received this transmission in error, please notify us immediately by telephone, at our expense and destroy the information.

The purpose of this memo is to present the traffic analysis results of the five (5) alternatives in the Environmental Impact Report (EIR). The five (5) alternatives included in the EIR and evaluated from a traffic perspective are the following: No Project/No Development Alternative 1, No Project/Development Under Existing Plans Alternative 2, Commercial Only Alternative 3, Medical Office/Senior Housing Alternative 4, and the No Retail Alternative 5. For each EIR alternative, the difference in daily and peak hour trip generation (alternative vs. proposed) was utilized to determine whether the impacted streets, intersections, and ramps would or would not be significantly impacted based on the reduction in trips from each alternative. Only the significantly impacted streets, intersections, and ramps that would occur under the proposed project were evaluated. The analyzed alternatives would not result in any new significant traffic impacts because trips are less than the proposed project. The Existing with Project, Near Term with Project and Long Term Cumulative (Year 2030) with Project scenarios were evaluated for each alternative. For Alternatives 2 – 5, two phases were analyzed (Phases 1&2 and Build-out) under Existing with Project, Near Term with Project and Long Term Cumulative (Year 2030) with Project conditions. Alternative 1 assumes no development occurs.

If project traffic from the EIR alternatives causes a roadway facility or intersection that operates acceptably to operate unacceptably, then the project has a significant impact. Two criteria must be met to determine a significant impact and before project mitigation is proposed. First, the intersection or street segment must have an unacceptable level of service (LOS), i.e. E or F. Second, the amount of project traffic must be significant based on the application of criteria discussed below and illustrated in Table 4-2 of the traffic study. For an

intersection, if the change in delay is greater than 2 seconds or 1 second and the level of service is “E” or “F” respectively, then the intersection project impacts would be considered significant. For a street segment, if the change in volume to capacity ratio (V/C ratio) exceeds 0.02 or 0.01, and the level of service is “E” or “F” respectively, then the street segment would be considered significantly impacted. A ramp meter would be significant if the change in delay is greater than 2 minutes or 1 minute for LOS “E” and “F” respectively using the most restrictive meter rate method.

No Project / No Development (Alternative 1)

This alternative assumes the project does not proceed and the site remains vacant and graded as it currently exists with no development. Since no development occurs in this alternative, then it would not generate additional traffic and therefore not have any significant traffic impacts. In the Near Term without Project and Long Term Cumulative (Year 2030) without Project scenarios, traffic would remain the same as shown in the Traffic Impact Analysis with a few intersections and street segments projected to operate at LOS E and F.

No Project / Development Under Existing Plans (Alternative 2)

This alternative assumes developing the site to include approximately 500,000 square feet of corporate and multi-tenant office under the current land use and zoning of the Community Plan. The 500,000 square feet of corporate and multi-tenant office would generate 6,497 average daily trips (ADT) with 895 AM peak hour trips and 935 PM peak hour trips, see **Attachment 1**. The alternative represents an approximately 76% reduction in ADT with a 42% reduction in AM trips and 68% reduction in PM trips compared to the proposed project.

In the Existing with Project condition, potentially significant direct traffic impacts on street segments would occur under Alternative 2 on El Camino Real between Via de la Valle to San Dieguito Road and Via de la Valle between San Andres Drive to El Camino Real (West). These same significant impacts occur for the proposed project as well due to the failing levels of service at these locations. As shown in **Attachment 2**, the segment of El Camino Real between the Via de la Valle and San Dieguito Road is operating at level of service “F” in the existing condition. On El Camino Real between Via de la Valle to San Dieguito Road, this roadway operates at an unacceptable level of service “F” in the existing condition. Therefore, any minor project traffic added to this roadway could potentially cause a significant direct impact. Since the project under Alternative 2 is smaller

compared to the proposed project, only one phase is analyzed in each scenario. In Alternative 2, the project shows a change in v/c of 0.013 which is still above the threshold for significance, i.e. (0.01). The street segment of Via de la Valle between San Andres Drive to El Camino Real (W) remains a significant direct impact as a result of the change in v/c ratio over 0.01 since the segment operates at LOS "F". As shown in **Attachment 3**, the intersection of Carmel Creek Road at Del Mar Trail is reduced from a change in delay of 4.6 seconds (Proposed Project) to 2.7 seconds as a result of the No Project/Development under Existing Plan alternative project. However, the change in delay is still higher than 2.0 seconds for intersections operating at LOS "E". Therefore, this intersection remains a significant direct impact. In the Existing with Project condition, there are no significant impacts to the freeway main-lanes or ramp meters, so no analysis is needed.

In the Near Term condition, potentially significant traffic impacts on street segments would occur on Del Mar Heights Road between I-5 NB ramps and High Bluff Drive, El Camino Real between Via de la Valle and San Dieguito Road as well as Via De La Valle between San Andres Drive to El Camino Real (West). See **Attachment 4**. The Near Term with Project (Phase 1 & 2) scenario from the proposed project was used to compare the alternative project in the Near Term scenario. The entire alternative is assumed to be constructed in this scenario and analyzed as such. As shown in **Attachment 4**, the segments on El Camino Real and Via de la Valle have a change in v/c of 0.013. Consequently, these segments remain significant under Alternative 2 because the segments operate at LOS "F" and above the allowable v/c change of 0.01. Del Mar Heights Road has a change in v/c of 0.042 which is above the allowable change in v/c for significance. For intersections in the Near Term condition, potentially significant traffic impacts would occur under Alternative 2 at three locations: Del Mar Heights Rd at High Bluff Drive; Del Mar Heights Rd at El Camino Real; and Carmel Creek Rd at Del Mar Trail. See **Attachment 5** for the calculations. These significant intersection impacts were also identified for the proposed project. Impacts to these intersections are reduced by the Alternative 2 project, however, they remain significant. Since no significant traffic impacts occur on ramp meters or freeway mainlines in the Near Term scenario for the proposed project, this alternative did not analyze any ramp meters or freeway mainlines. In comparison to the proposed project in the Near Term condition, Alternative 2 would result in the same potentially significant traffic impacts to roadway segments and intersections.

In the Long Term Cumulative (Year 2030) condition, potentially significant traffic impacts on street segments would occur on El Camino Real between Via de la Valle and San Dieguito Road as well as Via de la Valle between San Andres Drive to El Camino Real (West) as shown in **Attachment 6**. A level of service analysis

was used for Alternative 2 in the Existing, Near Term and Long Term Cumulative (Year 2030) scenarios. As previously mentioned, both street segments exceed the threshold of significance. Impacts to the same two street segments remain significant under Alternative 2 as compared to the proposed project. For intersections in the Long Term Cumulative (Year 2030) condition, potentially significant traffic impacts would occur at five locations under Alternative 2: Del Mar Heights Rd at I-5 NB ramps; Del Mar Heights Rd at High Bluff Drive; Del Mar Heights Rd at El Camino Real; El Camino Real at SR-56 EB on-ramp; and Carmel Creek Rd at Del Mar Trail, see **Attachment 7**. The calculations on significantly impacted intersections show the change in delay is significant notwithstanding the 42% reduction in AM peak trips and 68% reduction in PM peak trips. As shown, the impacts to the intersections remain the same under Alternative 2 as compared to the proposed project. For ramp meters, three significant traffic impacts occur at Del Mar Heights Rd at I-5 SB and NB on-ramps, see **Attachment 8**. The calculations below the table show all three impacts have a change in delay greater than 2 minutes which is considered a significant impact for Alternative 2. No significant traffic impacts occur on freeway mainlines for Alternative 2 in the Year 2030 condition. In comparison to the proposed project in the Year 2030 condition, Alternative 2 would result in the same potentially significant traffic impacts to roadway segments, intersections and freeway on-ramps. However, of the analyzed alternatives, Alternative 2 has the least amount of impact to the study area intersections, streets segments, and freeway ramps due to the reduction in trip generation compared to the proposed project.

Commercial Only (Alternative 3)

The Commercial Only alternative assumes developing the site to include 245,000 square feet corporate office; 291,000 square feet multi-tenant office; 220,000 square feet community shopping center; and a 10 screen (1,200 seats) cinema. No residential uses or hotel would be constructed in Alternative 3. **Attachment 9** shows the Commercial Only alternative would generate 22,843 average daily trips (ADT) with 1,217 AM peak hour trips and 2,544 PM peak hour trips. Alternative 3 represents an approximately 15% reduction in ADT with a 21% reduction in AM trips and 13% reduction in PM trips compared to the proposed project.

In the Existing with Project (Phases 1 & 2) condition, potentially significant direct traffic impacts on street segments would occur on Del Mar Heights Road between the I-5 NB ramps and High Bluff Drive, El Camino Real between Via de la Valle to San Dieguito Road, and Via de la Valle between San Andres Drive to El Camino Real (West). As shown in **Attachment 10**, all three significantly impacted segments operate at unacceptable levels of service today. Therefore, adding almost any amount of project traffic to these three

roadways that cause the segment to exceed the significance thresholds would result in a significant impact. Two of the street segments are reduced to a change in v/c ratio of 0.031 in comparison to the proposed project. However, all three segments remain significantly impacted under Alternative 3. **Attachment 11** illustrates the comparison of Existing and Existing with Project in the build-out scenario. The 15% reduction in ADT for the Commercial Only alternative is not enough to eliminate any significant impacts. However, they would lessen the severity of the impacts on two of the segments to a change in v/c ratio of 0.046 in the build-out scenario. As shown in **Attachment 12**, the intersection of Carmel Creek Road at Del Mar Trail is reduced from a change in delay of 2.9 seconds (Proposed Project) to 2.3 seconds as a result of the Commercial Only alternative project. However, the change in delay is still higher than 2.0 seconds for intersections operating at LOS "E", so therefore, this intersection remains a significant direct impact. A similar comparison in the Existing with Project at build-out is illustrated in **Attachment 13**. Since there are no significant impacts to the freeway main-lanes or ramp meters in the proposed project in the Existing with Project (Build-out) scenario, the Commercial Only alternative did not analyze any freeway main-lanes or ramp meters. Because the Commercial Only alternative generates lesser trips than the proposed project and no significant impacts occur as a result of the proposed project, we conclude that no new significant impacts would occur under Alternative 3 in the Existing with Project scenario.

In the Near Term condition, three segments are shown on **Attachment 14** to be significantly impacted. The Near Term with Project (Phase 1 & 2) from the proposed project was used to compare Alternative 3 in the Near Term scenario. The Commercial Only alternative has only a 15% reduction in ADT compared to the proposed project, therefore, the change in impacted street segments is only reduced slightly, see **Attachment 15**. For intersections in the Near Term condition, potentially significant traffic impacts would occur at three locations: Del Mar Heights Rd at High Bluff Drive; Del Mar Heights Rd at El Camino Real; and Carmel Creek Rd at Del Mar Trail. **Attachment 16** demonstrates that the AM reduction is 21% and the PM reduction is 13% for the Commercial Only alternative. The traffic impact analysis shows no significant impacts to freeway main-lanes or ramp meters in the Near Term scenarios as a result of the proposed project. Based on this analysis and the Commercial Only alternative having lesser trips than the proposed project, no analysis to freeway main-lanes or ramp meters was necessary under Alternative 3.

Attachment 17 identifies five (5) intersections in the Long Term Cumulative (Year 2030) condition that operate at unacceptable levels of service and have significant impacts. With a 21% AM peak hour reduction

and a 13% PM peak hour reduction, all five intersections remain a significant impact. Ramp meters were also evaluated to determine if the Commercial Only alternative would reduce and/or remove a significant impact. As shown in **Attachment 18**, the I-5 SB loop on ramp at Del Mar Heights Road in the AM peak hour is reduced to 5.8, however, remains a significant impact. No significant traffic impacts occur on freeway mainlines for Alternative 3 in the Long Term Cumulative (Year 2030) condition.

Medical Office / Senior Housing (Alternative 4)

The Medical Office / Senior Housing alternative assumes developing the site to include 425,000 square feet of medical office and 600 senior housing dwelling units. **Attachment 19** shows the medical office / senior housing alternative would generate 23,650 average daily trips (ADT) with 1,467 AM peak hour trips and 2,365 PM peak hour trips. Alternative 4 represents an approximately 12% reduction in ADT with a 5% reduction in AM trips and 19% reduction in PM trips compared to the proposed project.

Attachment 20 and **Attachment 21** illustrates the Existing with Project street segment comparison tables. The calculations represent a 12% reduction in ADT. The level of significance is only reduced to a change in v/c ratio of 0.048 in the Build-out scenario. All three segments remain a significant impact based on the criteria mentioned earlier. Only one intersection is evaluated in Alternative 4 as shown in **Attachment 22** and **Attachment 23** because there is only one significant intersection impact in the Existing with Project (Build-out) scenario. Since the reduction in the AM peak hour is only 5%, the intersection remains a significant impact showing a change in delay of 2.7 seconds in the Existing with Project (Phase 1&2) scenario and a change in delay of 4.4 seconds in the Existing with Project (Build-out) scenario. As previously mentioned, the impact to this intersection remains significant under Alternative 4.

The Near Term street segment comparison table in **Attachment 24** shows three segments operate at unacceptable levels of service and are significantly impacted. With an ADT reduction of 12%, Alternative 4 reduces the impacts to these segments but the impacts remain significant. **Attachment 25** shows a similar reduction in the v/c ratio for the Long Term Cumulative (Year 2030) condition.

For intersections, the Medical Office / Senior Housing alternative reduces the AM peak hour traffic by 5% and the PM peak hour traffic by 19%. The Near Term intersection calculations are demonstrated on **Attachment 26** and the Long Term Cumulative (Year 2030) intersection calculations are shown on **Attachment 27**. All of the significantly impacted intersections under the proposed project remain significantly impacted under Alternative 4.

Attachment 28 illustrates the ramp meter analysis and calculations used in the AM peak hour and PM peak hour. The same reduction used for intersections is also used for ramp meters to determine if the ramps remain a significant impact with the Medical Office / Senior Housing alternative. As shown, both ramps remain a significant impact under Alternative 4.

No Retail (Alternative 5)

Alternative 5, the No Retail alternative assumes developing the site to include 245,000 square feet corporate office; 270,000 square feet multi-tenant office; a 150 room hotel; and 608 multi-family dwelling units. **Attachment 29** shows this alternative would generate 10,480 average daily trips (ADT) with 1,142 AM peak hour trips and 1,270 PM peak hour trips. Alternative 5 represents an approximately 61% reduction in ADT with a 26% reduction in AM trips and 57% reduction in PM trips compared to the proposed project.

The street segment comparison in the Existing with Project scenarios is provided in **Attachment 30** and **Attachment 31**. A 61% reduction in the v/c ratio is used to determine if the reduction would remove a significant impact to any of the three street segments. In **Attachment 30**, on El Camino Real and Via de la Valle, the reduction shows 0.014 in the change in v/c. If the change in v/c was less than 0.01 on these two segments, there would be no significant impact. The impacts to these three segments are reduced more than Alternative 3 and 4 segments were reduced in this scenario, however, they remain significant.

The intersection summary in the Existing with Project scenario shows only one intersection to be evaluated, see **Attachment 32** and **Attachment 33**. Only one intersection is evaluated based on the proposed project causing a significant impact at this location in the Existing with Project scenario. With an AM peak hour reduction of 26%, the intersection of Carmel Creek Road at Del Mar Trail remains a significant impact.

In the Near Term scenario, the street segments are shown to be reduced to a change in v/c of 0.014 on two segments, see **Attachment 34**. For Long Term Cumulative (Year 2030) street segments, the change in v/c is reduced on El Camino Real and Via de la Valle from 0.054 to 0.021 which is more of a reduction than Alternative 3 and 4, see **Attachment 35**. On Del Mar Heights Road, the change in v/c ratio is reduced from 0.175 to 0.069. These street segments remain significantly impacted under Alternative 5.

Attachment 36 shows three intersections in the Near Term scenario that remain a significant impact even with the AM peak hour reduction of 26% and the PM reduction of 57%. In the Long Term Cumulative (Year 2030) intersection comparison table, the level of significance is reduced by over half (57%) in the PM peak hour, however, remain a significant impact, see **Attachment 37**.

Attachment 38 illustrates the ramp meter analysis and calculations used in the AM peak hour and PM peak hour. The same reduction used for intersections is also used for ramp meters to determine if the ramps remain a significant impact. As shown, both ramps remain a significant impact as a result of Alternative 5.

	PM	0.00	0	0.00	0	0.00 NO

AM Peak Reduction = 26%

DMH / I-5 SB AM: $7.34 \times 0.26 = 1.9$; $7.34 - 1.9 = 5.44$ (Remains a significant impact)

PM Peak Reduction = 57%

DMH / I-5 SB PM: $24.62 \times 0.57 = 14.0$; $24.62 - 14.0 = 10.62$ (Remains a significant impact)

DMH / I-5 NB PM: $7.74 \times 0.57 = 4.41$; $7.74 - 4.41 = 3.33$ (Remains a significant impact)

15 Minute Max. Meter Rate

Notes:

Δ = Change in Delay (minutes)

S = Significant, the allowable increase in delay at a ramp meter with more than 15 minutes delay and freeway LOS E is 2 min.

S = Significant, the allowable increase in delay at a ramp meter with more than 15 minutes delay and freeway LOS F is 1 min.
